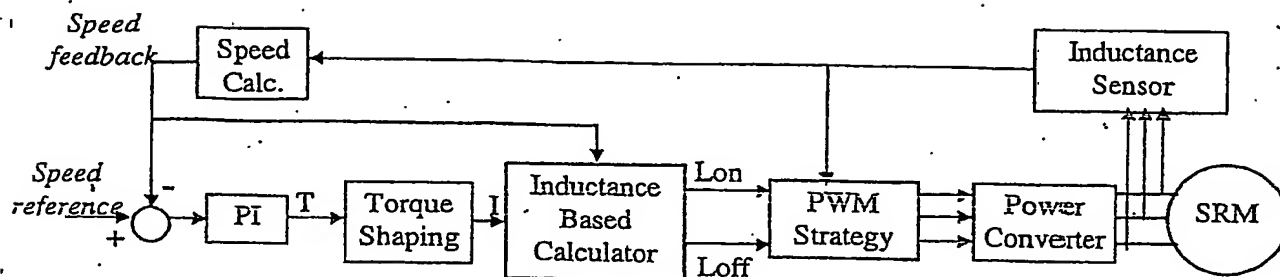

Figure 3.10 Use of Inductance for Direct Commutation

Since there is at least one idle phase in a SRM the inductance of that phase can be sensed for the purpose of commutation control. The phase inductance of the idle phase is estimated from the measurements of the motor terminal voltages and currents. The commutation instants of the active coil are expressed in terms of the phase inductance value of the idle phase: L_{on} and L_{off} . The commutator compares the instantaneous supplied coil inductance L with the values L_{on} and L_{off} and commutates the corresponding coil current.
